A ONLINE SUPPLEMENTAL MATERIAL

This appendix is available online for reviewers' use at the following anonymized GitHub repository:
https://github.com/icse20/RT-CI.
Material for verifiability and replicability of the experiments is at the same repository.

The appendix contains: the settings of the prioritization algorithms; results for RQ1, RQ2 and RQ3 not presented in the main article for the sake of space.

A.1 Algorithm parameters

Table 1 reports the parameters setting of the experimented algorithms. In all the cases except two, the default parameters are adopted: for RankNet and LambdaMART, due to overfitting causing NaN occurrences in the ranking, we needed to lower the number of epochs and trees, respectively, until obtaining a valid result.

A.2 RQ1

Figures 1a-1f and 2a-2f report the *RPA* and *ranking time* boxplots for each subject.
Figures 3a-3f report the total training times (ms) per subject, in logarithmic scale.

Table 1: Algorithms parameters settings

Algorithm	Parameters		Library
KNN	k=4	SearchAlgorithm = LinearNNSearch	WEKA
RF	Tree=100	SplitCriterion = Information Gain Ratio	KNIME
L-MART	Tree=30	Leaf=10 shrinkage=0.001	Ranklib
MART	Tree=1000	Leaf=10 shrinkage=0.001	Ranklib
RankBoost	round = 300	tc=10	Ranklib
RankNet	Epoch=50 node=10	Layer=2 lr=0.00005	Ranklib
CA	randomRestarts=5	iterations=25 tolerance=0.001	Ranklib
RL	Layer=1 Neurons=12	solver=adam epsilon=1e-08 learning_rate_init=0.001	scikit-learn
RL-MLP	Layer=4 Neurons=12	solver=adam epsilon=1e-08 learning_rate_init=0.001	scikit-learn
RL-RF	Tree=100	SplitCriterion = Information Gain Ratio	KNIME

A.3 RQ2

Figures 4a-4f reports the T^2 Hotelling's statistic used to summarize the trend of the code metrics, computed on a set of principal components able to explain at least the 95% of the original metrics variance.

A.4 RQ3

Table 2f reports, for each subject, the difference between the tests execution times taken from the 25%, 50% or 75% of the list of tests sorted according to the *optimal* ranking and those taken from the 25%, 50% or 75% of the list of tests sorted according to the *predicted* ranking. Similarly, the difference between the total number of failing tests considering the 25%, 50% or 75% of optimal and predicted ranking.
